

# Features

(and Context)

An Exploration: Do you want to use these modules on your next site?

## Features (why use it?)

### **configuration into code like**

- ◆ views
- ◆ node types
- ◆ perms
- ◆ module dependencies

This means we have something that is repeatable, re-usable, and under version control

The developer can change a feature server and deploy  
or  
the client changes a feature and exports back to you to integrate  
(assuming you have a Drupal saavy client)

### **product**

A feature could be a product you offer to clients  
but it is not really ready (IMHO)

- ◆ need fserver
- ◆ fserver is in alpha
- ◆ not released on d.o

## Context

Used with features, it allows us to pull more configuration into code

- ◆ block configuration
- ◆ active menu items
